

PTFE Sheet

PTFE* sheets are non-stick and resistant to heat. Simply place the sheet on top of transfers or film to prevent direct contact with your heat press platen or iron. The sheets can also be used to protect delicate fabrics when pressing.

Covering finished transfers with a PTFE sheet and repressing for a few seconds will help to seal the transfer and give them a glossier look (remove the sheet when cold).

*For the technically minded, PTFE stands for polytetrafluoroethylene - the compound used in the manufacture of Teflon.
